Vector Backbone Description: Vector Backbone:n/a; Vector Types:; Bacterial Resistance:None

Comments: MG1655 was transformed with pKD46 (carrying phage lambda Red recombinase) and a PCR fragment encoding a kanamycin resistance gene with flanking nucleotide sequences homologous to those flanking the lac operon. Upon recombination and selection for resistant strains, the kanamycin-resistant gene was eliminated following transformation with pCP20 (encoding the FLP recombinase), which is subsequently cured by growth at 30°C. The deletion in our ?ZYA strain started 20bp upstream of lacI and ran 40bp downstream of lacA.
