**Proper Citation:** Behavior Enhances Drug Reduction of Incontinence (RRID:SCR\_001495)

**Description:** Multi-center randomized clinical trial to determine if the addition of behavioral treatment to drug therapy for the treatment of urge incontinence will make it possible to discontinue the drug and still maintain a reduced number of accidents. The most popular treatments for urge incontinence are drug therapy and behavior therapy, each with its own limitations. In this clinical study, the Urinary Incontinence Treatment Network (UITN) aims to determine differences with the addition of behavioral treatment to drug therapy alone.

Abbreviations: BE-DRI

Resource Type: bibliography, resource, clinical trial, data or information resource

**Defining Citation: PMID:16919506** 

**Keywords:** drug therapy, behavioral therapy, female, urinary incontinence, overactive bladder, combined modality therapy, quality of life, pelvic floor muscle exercise, tolterodine, clinical

Related Condition: Urge incontinence, Urinary Incontinence
