Proper Citation: Narcissistic Personality Inventory (RRID:SCR_003701)

Description: A test to measure narcissism as a personality trait in social psychological research. Although there are several versions, a forty-item forced-choice version (Raskin & Terry 1988) is the one most commonly employed in current research. It is based on the DSM-III clinical criteria for narcissistic personality disorder (NPD), although it was designed to measure these features in the general population. Thus, the NPI is often said to measure normal or subclinical (borderline) narcissism (i.e., in people who score very high on the NPI do not necessarily meet criteria for diagnosis with NPD). Raskin and Terry (1988) identified seven factors of the NPI (i.e., Authority, superiority, exhibitionism, entitlement, vanity, exploitativeness and self-sufficiency), mapping roughly onto the DSM criteria for NPD. Since then, several studies have further examined the factor structure of the NPI with varying results. It should take most people five to ten minutes to complete.

Abbreviations: NPI
